

Note: Before performing a system-reset, always create a system backup of the ACOS device to allow you to always restore be able to restore the ACOS device from the backup when necessary.

Overview

An aVCS virtual chassis contains multiple ACOS devices ([Figure 61](#)). The vMaster acts as a controller for the other devices (vBlades), which function as blades in the virtual chassis. Apart from individual device management and VCS configurations, the vMaster can take care of the following operations:

- Synchronize configurations
- Synchronize certificates
- Synchronize keys
- Synchronize aFleX policies
- Synchronize black/white lists
- Synchronize code versions
